Mangalore, India · +91 73530 90355 · mfaizalf72@gmail.com · linkedin.com/in/mfaizalf72 · github.com/mfaizalf72

PROFESSIONAL SUMMARY

Full-stack developer with solid experience building and shipping **SaaS-style web applications** using **Java**, **Spring Boot**, **React.js**, and **MySQL** — comfortable across the backend API layer, relational database design, and responsive frontend integration. I take ownership of features end-to-end, test APIs systematically before connecting them to the UI, and debug issues across layers without needing help locating them. I have been expanding into **Node.js** and **Express.js** to broaden my backend JavaScript skills, and I am actively exploring testing workflows including **Jest** and browser automation concepts like **Playwright**. I use AI tools (ChatGPT, GitHub Copilot) as a daily part of my development workflow for faster debugging and implementation. I am looking for a product engineering role at a company building software that actually matters — and CUBE's AI-driven **regulatory compliance platform** is exactly the kind of complex, high-stakes domain I want to contribute to.

TECHNICAL SKILLS

Languages: Java, JavaScript ES6+, Node.js (Basics), Python (Basics), SQL

Frontend: React.js, HTML5, CSS3, Responsive Design, Component-Based Architecture

Backend: Spring Boot, REST API Development, Hibernate ORM, JPA, JWT Authentication, Express.js (Basics), API Development, Microservices (Basics)

Databases: MySQL, MongoDB (Basics), Relational Database Design

Testing & Automation: API Testing (Postman), Jest (Familiarity), Debugging, Chrome DevTools, Browser Automation Awareness (Playwright, Puppeteer)

Engineering: OOP, Data Structures, Problem Solving, Agile/Scrum, Performance Optimization (Basics)

Cloud & DevOps: Git, GitHub, CI/CD Awareness, Docker (Basics), Railway, Vercel

AI & Productivity: AI-Assisted Development (ChatGPT), GitHub Copilot (Familiarity)

PROFESSIONAL EXPERIENCE

Full Stack Developer Intern

ExcelR Solutions

Aug 2025

Bengaluru, Karnataka, India

- Built scalable **SaaS-style web applications** end-to-end — developing **Spring Boot REST APIs**, connecting them to **React.js** frontends via async JavaScript, and managing MySQL database schemas with Hibernate ORM across multiple sprint-based projects.
- Tested every API endpoint in **Postman** before frontend integration — validating HTTP methods, status codes, error responses, and edge cases, and began exploring **Jest** concepts for frontend component testing to support more comprehensive **testing workflows**.
- Debugged issues across the full stack systematically using **Chrome DevTools** for frontend state problems and structured logging for backend errors — isolating the layer first, then investigating, which consistently finds root causes faster than guessing.
- Practiced **Git workflows** (feature branching, pull requests, code review) in a collaborative **agile team environment** and used ChatGPT and GitHub Copilot daily to accelerate debugging, scaffolding, and implementation decisions.

Project Planning & Operations Engineer

PlantTech (Saudi Aramco Project)

Jan 2025 – Jul 2025

Riyadh, Saudi Arabia

- Managed **workflow tracking**, **operational reporting**, and issue coordination for a large Saudi Aramco infrastructure project — maintaining structured dashboards, validating data consistency across sources, and delivering weekly KPI reports to senior stakeholders under deadline pressure.
- Identified and resolved reporting workflow inefficiencies through structured **process optimization** — the same isolate-understand-fix approach I apply to software debugging — which improved dashboard reliability and reduced manual reconciliation effort.
- Coordinated across engineering, procurement, and client teams simultaneously, using clear written communication and structured **documentation** — building the cross-functional collaboration habits that **agile SaaS product teams** rely on.
- Operated with **ownership and independence** in a high-stakes enterprise environment where accuracy and follow-through were non-negotiable — the professional discipline that maps directly into how I approach software delivery.

PROJECTS

- Compliance Workflow Automation Portal** | *React.js, Spring Boot, Node.js, MySQL, REST APIs* 2026
- A **SaaS-style compliance workflow platform** for tracking operational tasks, managing approval flows, and generating audit-ready reporting summaries — designed around the data accuracy and auditability requirements common in **regulatory compliance environments** like CUBE's.
 - Built the **React.js** frontend with **component-based architecture** — a task tracking view, approval workflow interface, and status dashboard that update from live API responses and maintain consistent state across user interactions.
 - Designed **Spring Boot REST APIs** for workflow operations, user management, and audit trail logging, and explored **Node.js** and **Express.js** for lightweight backend routing concepts — deliberately expanding into the JavaScript backend ecosystem alongside my Java experience.
 - Applied systematic **API testing with Postman**, modular architecture practices, and structured **Git workflows** throughout — building the reliability and **maintainability** standards that compliance-critical SaaS applications require.
- Team Task Manager App** | *React.js, Spring Boot, MySQL, REST APIs, JWT Auth, Railway, Vercel* 2026
- Full-stack collaborative **SaaS-style** task and project management platform — project tracking, task assignment, role-based dashboards, and status workflows built with **JWT authentication** and server-side authorization enforcement on every API route.
 - Built modular **React.js** components with clean separation between data fetching, state management, and UI rendering — making the frontend easy to extend without touching unrelated parts of the application.
 - Designed a normalized **MySQL** schema and tested all **REST API** endpoints in Postman with systematic edge-case coverage before any frontend integration — a workflow habit that prevents integration bugs from being mistaken for frontend bugs.
 - Deployed frontend on **Vercel** and backend on **Railway** with full production configuration (environment variables, CORS, database connectivity) — completing the end-to-end software delivery cycle with a live accessible application.
 - [Live: team-task-manager-frontend-delta.vercel.app](https://team-task-manager-frontend-delta.vercel.app) [Code: github.com/mfaizalf72/team-task-manager-frontend](https://github.com/mfaizalf72/team-task-manager-frontend)
- FoodScribe — Food Ordering & Subscription Platform** | *Java, Spring Boot, Hibernate, MySQL, REST APIs* 2025
- Production-deployed **SaaS-style** platform with subscription lifecycle management, order tracking, and admin operational dashboard — 15+ **REST APIs**, an 8-table normalized MySQL schema, and live deployment accessible at a public URL.
 - Implemented the **DTO pattern** throughout to separate internal data models from API responses — a design decision that improves security, reduces data leakage, and makes it safe to evolve the database without breaking API consumers.
 - Applied **performance optimization** at the database layer through indexing, query restructuring, and Hibernate fetch strategy decisions — and used **Chrome DevTools** to profile and address frontend rendering performance issues.

EDUCATION

- Srinivas Institute of Technology** Mangalore, India
Bachelor of Engineering — Computer Science *Graduated May 2024*
- CGPA: 7.51 / 10 · Coursework: Data Structures, OOP, DBMS, Software Engineering, Computer Networks

SAAS ENGINEERING & DEVELOPMENT PRACTICES

How I build APIs: REST endpoints with clean JSON contracts, proper HTTP status codes, input validation, and error responses that tell the client what actually went wrong. Tested in Postman with positive, negative, and edge cases before the frontend ever connects.

Frontend/backend integration: I connect React frontends to REST backends by building and verifying each API in isolation first. Integration bugs are much faster to fix when you know the API is already correct before you add the frontend.

Testing on my radar: I have been studying Jest for frontend unit testing and exploring Playwright/Puppeteer for browser automation concepts. My current habit is thorough Postman API testing; Jest and E2E automation are the natural next steps I am actively working toward.

Git and team engineering: Feature branches, pull requests, descriptive commit messages. I write code that someone who was not involved in the feature can read and extend — which is what makes teams move faster, not slower, as a codebase grows.
